

From Stone Age to AI-Native.

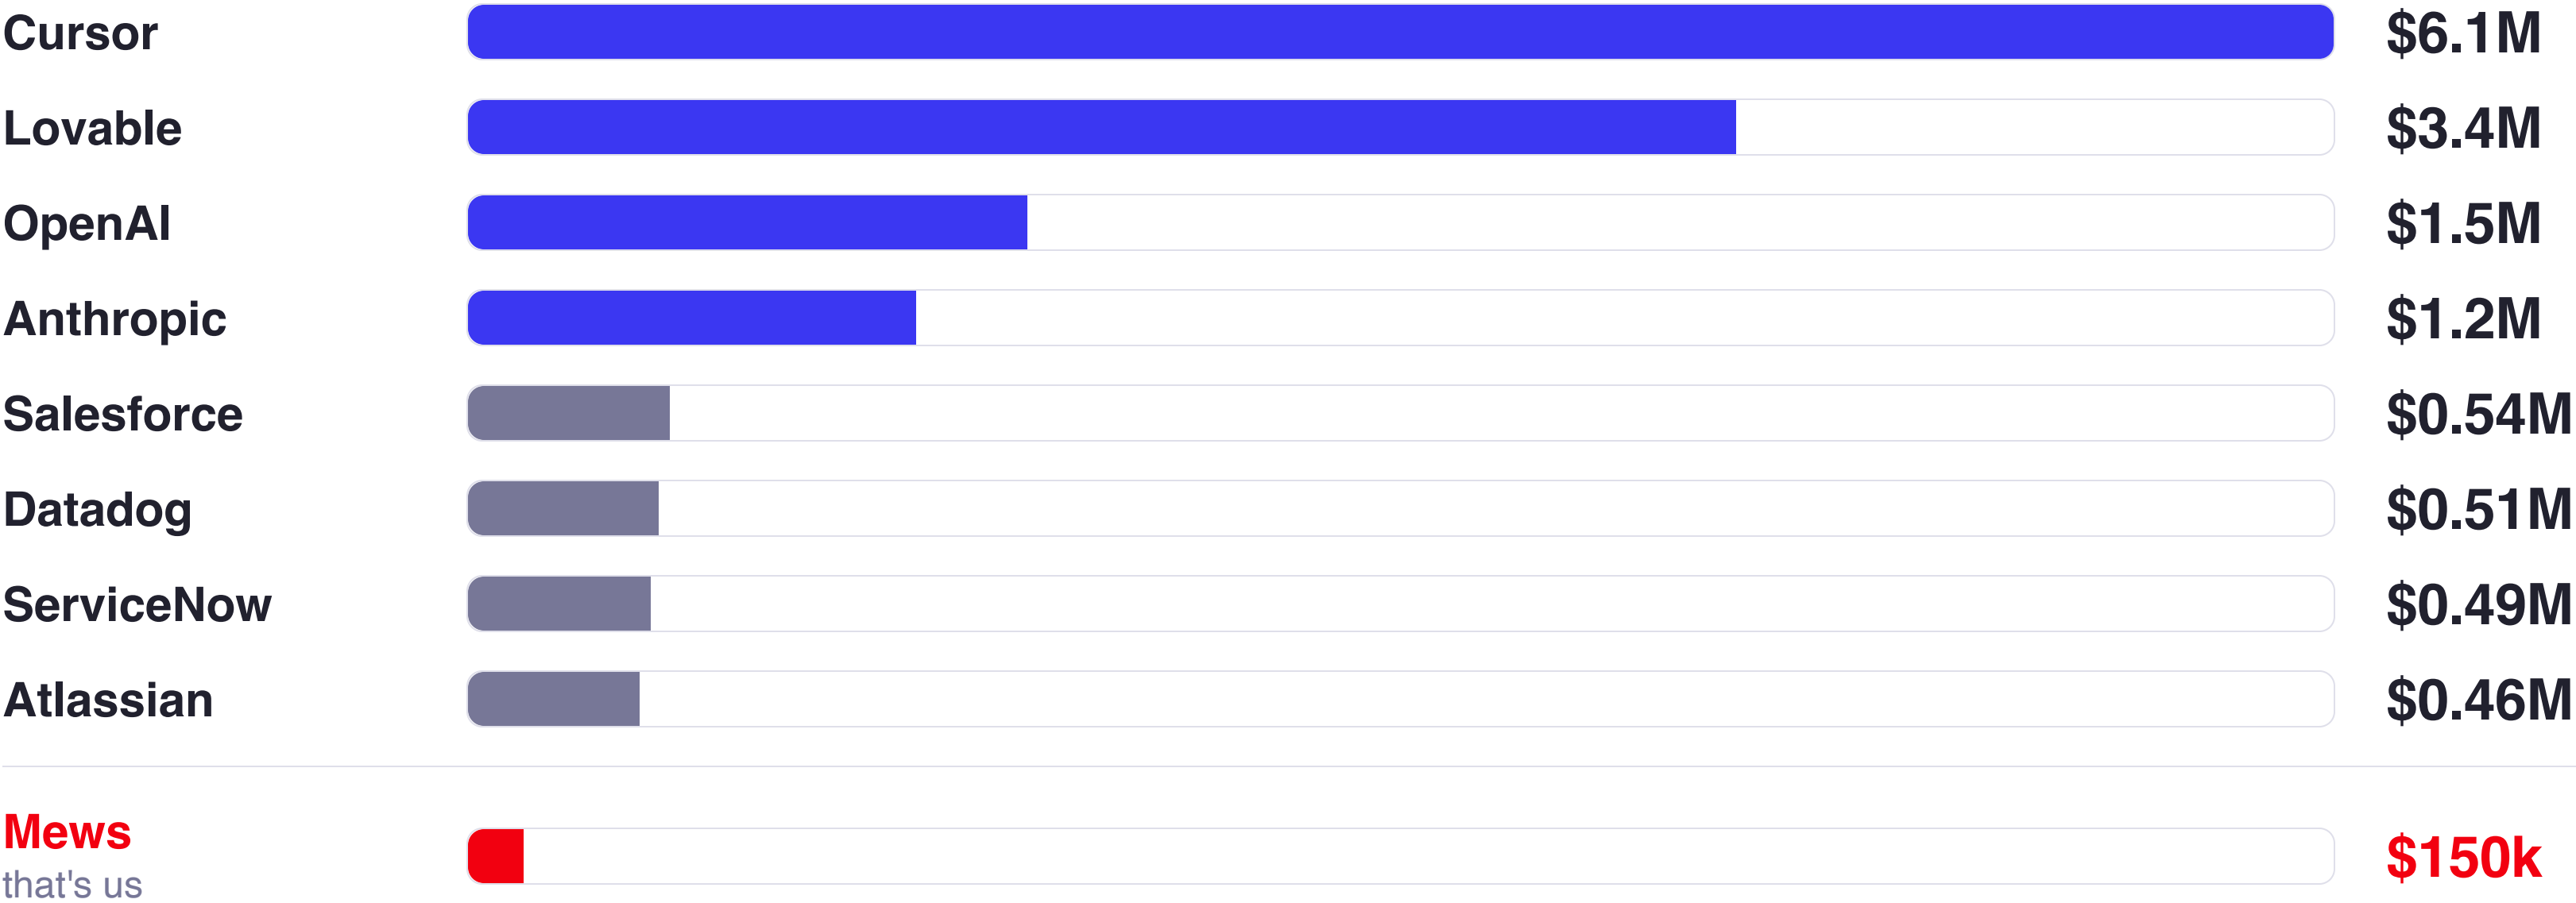

The future of work, the future of roles, and the future of R&D at Mews.

01

MACRO · THE WORLD

We live in a wonderful time,
witnessing a complete regime
change in how work gets done.

ARR per employee, when small teams wield big systems.

NEWS Small, focused teams plus powerful systems is the unfair advantage of this era. The gap is the opportunity.

Intercom: **3x the velocity**, same wonderful people.

Engineering output

3x

Engineers shifted from writing every line to upskilling agents that do the work alongside them.

The unlock wasn't a better model. It was a different **shape of work**. Fewer humans on the keyboard. More humans steering systems.

Same building. Same payroll. Three times the throughput. That is what becomes possible.

Brave companies are letting agents run more of the company.

Intercom

Engineers upskill the agents. Agents handle the work.

3x velocity

Ramp

Built **Glass**, a platform that does work for every role.

Internal AI platform

Wiz

A just-in-time enablement agent replaces manual enablement.

Sales · GTM

Airbnb

A remote orchestration platform that elevates every engineer an engineering manager.

Operations

The common thread isn't "we added AI as a co-worker." It's "**we let agents run more of the company.**"

From human **in** the loop, to human **ON** the loop.

Humans in the loop become the bottleneck. Humans on the loop tune the system.

BEFORE		AFTER	HUMAN'S JOB
Human reviews every pull request.	→	AI reviews pull requests.	Improve the PR review agent.
Human investigates incidents.	→	AI investigates and fixes the incident.	Improve the incident-response agent.
Human does sales enablement.	→	AI does just-in-time enablement.	Improve the enablement system.

A new **brain of operations** in the cloud runs the company day to day. Our job becomes the operational tasks it can't do, and continuously tuning the system that does the rest.

02

ROLES · THE PEOPLE

The death of **the muddy middle**.

Every role faces a choice. Go broader and own outcomes, or go deeper and own a system. Not both half-way.

Narrow, then T-shaped, now two beautiful extremes.

YESTERDAY

Narrow specialists

UI, UX, content, visual designer

Front end, back end, mobile engineer

QA, release, ops

Hand-offs between every step

THEN

T-shaped generalists

Product Designer

Software Engineer

Full-stack and DevOps blur the lines

One person owns more of the work

TODAY, WITH AI

Function-level generalists

Outcome Owners own outcomes end to end

System Builders make the system better

The muddy middle dissolves

Agents do most of the execution

TWO HATS. EVERYBODY WEARS BOTH.

You build the system, or you build the outcome. Often both.

SYSTEM BUILDERS

Build the brain and the agents.

Design the central intelligence. Decide what agents exist, what data they see, which tools they call, how feedback loops back.

LOOKS LIKE

Product Manager improving the prioritization agent

Security Engineer hardening agent guardrails

Sales Enablement Specialist improving just-in-time enablement

MEWS · Roles

OUTCOME OWNERS

Do the job systems can't.

Pick up whatever the system can't handle on its own and carry it to the finish. Review agent drafts, work edge cases, close the loop with the customer. Then turn every fix into a lesson the system inherits.

LOOKS LIKE

Product Builder shipping new features

Sales Rep selling to a customer

CSM challenging the customer in their goals

A manager is **both at once**. Their team's Outcome Owner and its System Builder.

AS OUTCOME OWNER

You carry the team's number.

The metric is yours. Customer outcome, revenue, reliability, cycle time. You unblock, you escalate, you decide what ships and what doesn't. If the team misses, you missed.

AS SYSTEM BUILDER

You build the team that builds the system.

Hiring, rituals, tooling, agents, the codebase shape. Every week you ship a change to how the team works so next week needs less of you. Your leverage is the system, not your hours.

03

MEWS · THE WORK

So what does it mean for us?

An honest look at where we stand, the bets running today, and what we expect to see next.

Five shifts that **unlock the next gear.**

01 No code by hand. Moxly as our only coder.

No single line of code should be written manually, or even reviewed line by line. The keyboard belongs to agents. Humans steer.

02 Human on the loop, not in it.

We review the things that are hard to change — tests, contracts, design, data structures — not every diff. PR reviews give way to product and project reviews. PMs feed the prioritization agent instead of prioritizing themselves. Designers feed Claude Design instead of pushing pixels.

03 Atlas first.

Dedicated services are dramatically easier to spin up with AI — so the direction we were already taking should be massively accelerated. Atlas-shaped services are what enable the fast cycle times Product Builders need.

04 Invert work in progress.

Previously, three people on one epic. Now, one person on three epics. Parallelism of agents plus an up-level in the layer engineers operate at.

05 Product Builders are the new squads.

What used to take a whole squad — PM, designer, two engineers — is now possible with a single Product Builder steering agents. Smaller, more dynamic teams by default.

Glimpses of the future. **This should become the standard.**

1 week

ENGINEER · END-TO-END

One engineer shipped a complete **Co-pilot for Automations** end-to-end in a single week.

Automations

2 days

ENGINEERS · MULTI-PROPERTY

From idea to a live demo of a **new setup flow** for a real customer in two days.

Multi-Property

2–3 weeks

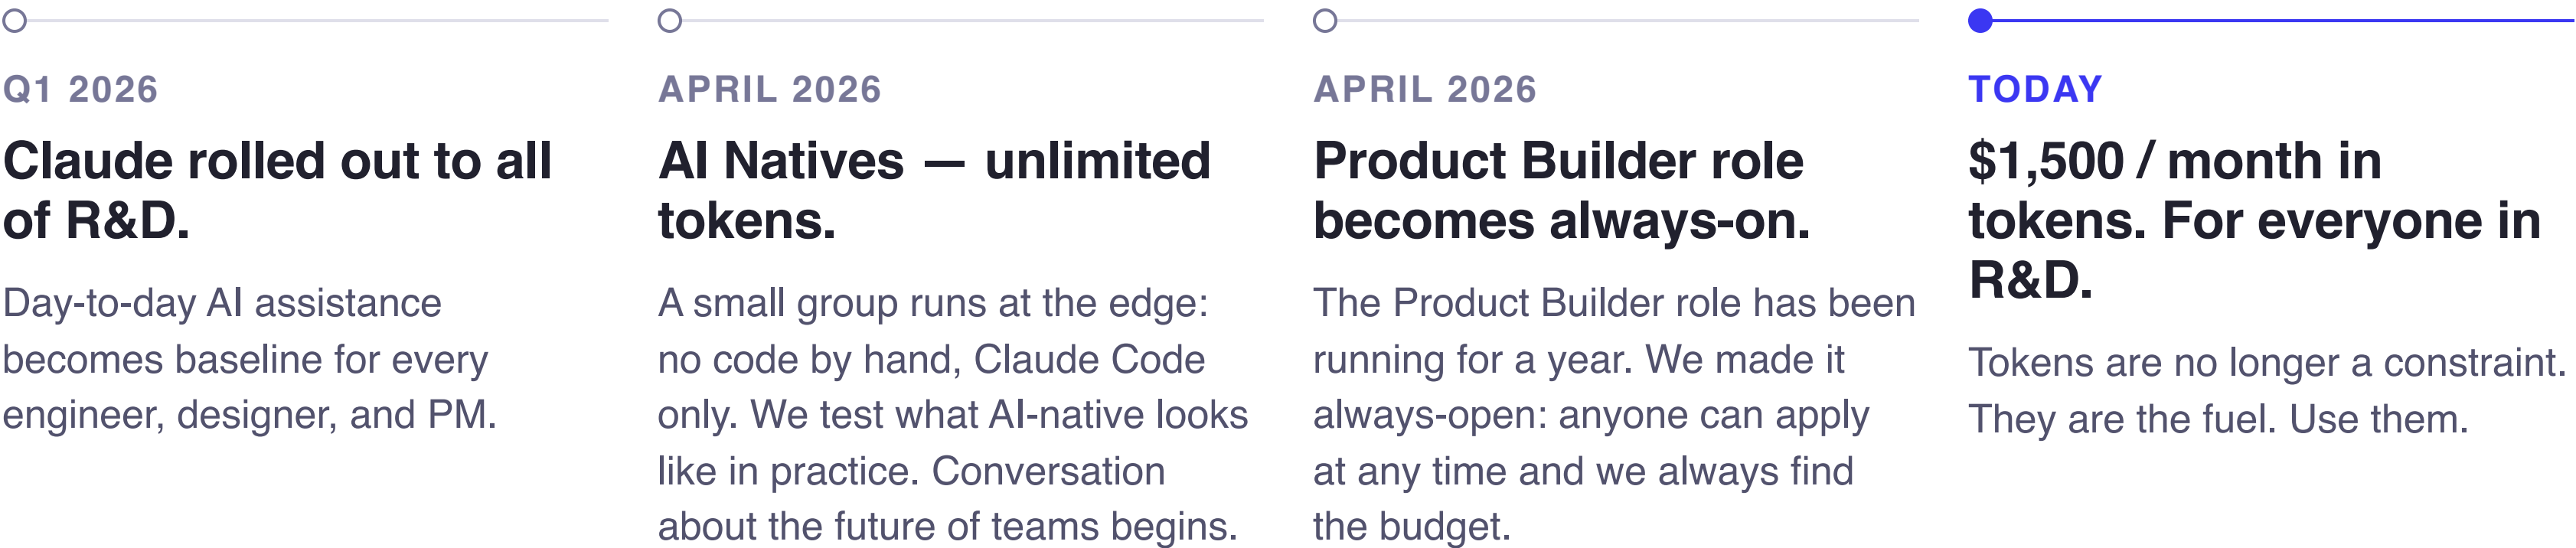

PRODUCT BUILDERS · IN PRODUCTION

Builders shipping full features **end-to-end into production** in two to three weeks.

Across R&D

Not the exception. **The standard we're working toward.**

Our path so far. **And accelerating.**

From experiment to default. **And accelerating from here.**

What to do on Monday.

01 Start building the system of your work. Stop being the system. Build it. Whatever you do today by hand, design the agent that does it instead.	FOR EXAMPLE PM — build a prioritization agent you feed, instead of doing it yourself. Engineer — Moxly should be the only coding engineer at Mews. Stop writing code; make Moxly better at writing it. Designer — make Claude Design your best designer for day-to-day tasks.
02 Fix the input, not the output. When the agent fails, don't fix the artifact. Fix the prompt, the context, the data it had access to. Each fix compounds.	FOR EXAMPLE Bad PR? Improve the prompt and the skills, not just this PR. Wrong design? Improve the design context, not just this screen. Every fix is a deposit into the system.
03 Use Atlas and Moxly — the shared platform. Atlas is becoming the shared team-building, agent and orchestration platform for all of R&D. Build on it. Contribute to it.	FOR EXAMPLE Spin services on Atlas, not in the monolith. Share skills, hooks, and agents across teams. Use and contribute to Moxly.
04 Don't optimize prematurely. It's fine to duplicate work, duplicate skills, duplicate agents. Right now, innovation and sharing what we learn matter more than being structured, centralized or efficient.	FOR EXAMPLE Two teams building similar agents? Great — we'll learn twice as fast. Don't wait for the 'right' platform before you start. Ship, share, then converge later.

THEN KEEP ASKING THE NEXT QUESTION

Don't stop at automating the task. **Climb the ladder.**

WORKED EXAMPLE · THE QBR

- 01 "Let's **automate the QBR**." Agent writes the report we used to write by hand.
- 02 Agent **makes recommendations** — new investments, sunset signals, bets to double down on.
- 03 Agent **writes the PRDs** based on the QBR.
- 04 Agent **prioritizes the PRDs** against each other and against what's already in flight.
- 05 Agent **implements the BRDs** — code, prototypes, the working thing.
- 06 **This happens all the time** — not just quarterly. A continuous loop, every day.

THE PATTERN

Every time the agent does the task, ask "**why am I asking for this in the first place?**" — then teach the agent to do *that* instead.

That's how a task becomes a workflow, a workflow becomes a continuous loop, and a loop becomes the new system. **The future of work is the system we tune every day.**

WHERE DO YOU SIT ON THE SCALE?

Two paths. Lean toward the side that fits you.

IF YOU'RE CLOSER TO OUTCOMES AND EXECUTION

Become a **Product Builder**.

You like steering products. Talking to customers. Owning a number. Apply for the **Product Builder** role — and even if you feel "not fully there yet," I strongly encourage you to put your hand up.

→ Apply for the Product Builder role.

IF YOU'RE CLOSER TO STRATEGIC THINKING

Level up by **teaching the system**.

PM, Product Designer, Engineer — these are absolutely roles of the future. They just look different. More strategic. Closer to what a **Staff PM, Staff Designer or Staff Engineer** looks like today: building the agents that do the work, owning a critical capability, raising the ceiling for everyone else.

→ Talk to your manager about broader scope or a path forward.

OUTCOMES

SYSTEMS

How can we deliver the
outcomes we planned for this
year — **this quarter** instead?

Not speed at the cost of quality. Speed **and** quality.
